

— A NO-JARGON FIELD GUIDE

CMPINF-2100

Good Bye, AI!

On the Road with VS Code

Set up a clean, distraction-free Jupyter Notebook and leave the robot in the backseat. Five easy steps from install to one-click launch.

Made for the **CMPINF-2100** crew · a DatJavaClass field guide

— YOUR ROAD MAP

Five short stops. By the end you will have a clean VS Code that has no AI looking over your shoulder, a notebook connected to your class environment, and a single icon that launches the whole thing.

1

Build the Profile

a fresh, empty VS Code

2

Silence the AI

one setting, no ghost text

3

Load the Gear

two extensions

4

Open a Notebook

connect to upitt

5

One-Click Launch

a desktop shortcut

! Two names. Do not mix them up.

YOUR PROFILE

No-AI

A saved VS Code setup. This is what we build and name in Stop 1. Call it whatever you like.

vs

YOUR ENVIRONMENT

upitt

Your class Python setup (the kernel). Some of you named it upitt. If yours has a different name, use that instead.

1

Build the AI-Free Profile

A blank, clean copy of VS Code that lives beside your normal one

- 1 Open VS Code.
- 2 Look at the very bottom-left corner and click the little **gear** icon (its tooltip says **Manage**).
- 3 In the menu, hover **Profiles**, then click **Create Profile...**
- 4 Give it a name you will remember. We will use **No-AI** in this guide.
- 5 Where it says **Copy from**, choose **None** so it starts completely empty.
- 6 Click **Create**. You are now inside your new, blank profile.

GOOD TO KNOW

Anything you install or change from here only affects this profile. Your regular VS Code stays exactly as it was.

2

Silence the AI

Newer VS Code has AI built in, so we switch it off instead of uninstalling

- 1 Make sure you are in your **No-AI** profile (check the gear menu at the bottom-left; the active one has a check mark).
- 2 Press **Ctrl** , (Control and the comma key) to open **Settings**. This is not the same as **Ctrl** **Shift** **P** which is for commands.
- 3 In the search bar at the top, type **disableAIFeatures** .
- 4 Tick the checkbox for **Chat: Disable AI Features**.
- 5 Clear the search, type **inline suggest** , and turn **off Editor › Inline Suggest: Enabled** as a belt-and-suspenders move.

WHY TWO SWITCHES

The first hides the AI chat and Copilot. The second kills any leftover grey "ghost text" that finishes your lines. Together, total quiet.

3

Load the Notebook Gear

Two official Microsoft extensions, installed into this profile only

- 1 Click the **Extensions** icon in the left bar (the four little squares), or press **Ctrl** **Shift** **X**.
- 2 Search **Jupyter** and install the one published by **Microsoft**.
- 3 Search **Python** and install the one published by **Microsoft**.

THAT IS ENOUGH

Jupyter gives you the notebook screen. Python lets VS Code find your **upitt** environment in the next step. You do not need anything else.

4

Open a Notebook & Connect to upitt

Make a fresh notebook and point it at your class environment

- 1 Press **Ctrl** **Shift** **P** to open the Command Palette.
- 2 Type **Create: New Jupyter Notebook** and press **Enter**. A blank notebook opens.
- 3 In the **top-right** of the notebook, click **Select Kernel**.
- 4 Choose **Python Environments...**, then pick **upitt** from the list. (Different name? Pick whatever you named your class environment.)
- 5 Click the first cell, type the line below, and press **Shift** **Enter** to run it.

```
print("Hello, no robots!")
```

- 6 See the words appear under the cell? You are connected. Save with **Ctrl** **S** and give the file a name ending in **.ipynb**.

upitt NOT IN THE LIST?

Make sure the Python extension from Stop 3 is installed, and that you actually created the class environment. Then reopen the kernel picker.

5

The One-Click Launch

A desktop shortcut that always opens straight into your No-AI profile

- 1 **Find where VS Code lives.** Right-click your existing VS Code icon → **Properties** (or **Open file location**) and copy the path to `Code.exe`. It usually looks like this:

```
C:\Users\YOU\AppData\Local\Programs\Microsoft VS Code\Code.exe
```

- 2 Right-click an empty spot on your **Desktop** → **New** → **Shortcut**.
- 3 In the location box, paste the line below, swapping in **your** real Code.exe path. Keep the quotes.

```
"C:\Users\YOU\AppData\Local\Programs\Microsoft VS Code\Code.exe" --profile "No-AI"
```

- 4 Click **Next**, name it **VS Code (No AI)**, click **Finish**, and double-click to test.

WANT IT TO OPEN A FOLDER TOO?

Add the folder path at the very end, in quotes:

```
"...\Code.exe" --profile "No-AI" "C:\Users\YOU\Documents\CMPINF-2100"
```

One line total: program in quotes, the flag, then the folder in quotes.

Bumps in the Road

The AI came back.

You were probably in a different profile when you flipped the switch. Reopen the **No-AI** profile and redo Step 2. If it keeps returning, turn off Settings Sync for extensions.

My shortcut opened the wrong setup.

The name after `--profile` must match your profile exactly. **"No-AI"** is not the same as **"no ai"** or **"NoAI"**. Capital letters and spaces count. Always keep the name in quotes.

upitt is missing from the kernel list.

Install the Microsoft **Python** extension (Step 3) into this profile, and confirm your class environment was created. Then open the kernel picker again.

I typed the setting name and nothing happened.

Settings go in the **Settings** screen (**Ctrl**, **,**), not the Command Palette (**Ctrl**, **Shift**, **P**). Two different screens.

You've Arrived.

A clean editor, no robot in the backseat, notebooks running on your own environment, and one icon that takes you straight there. Enjoy the quiet road.

- ✓ Profile built and named
- ✓ AI features switched off
- ✓ Jupyter + Python installed, connected to upitt
- ✓ One-click shortcut on the desktop
